

iglidur® M250 | Thick and Tough

Excellent vibration dampening. The self-lubricating plain bearings made of iglidur® M250 are defined by their impact strength, vibration dampening, and wear resistant properties. They excel in applications in which vibration dampening is necessary, for example, in fitness and packaging machines.

When to use it?

- When the bearings are exposed to high amounts of dirt
- When high vibration dampening is necessary
- For low to average speeds
- When mechanical reaming of the wall surface is necessary
- Resistant to edge loads
- High impact resistance
- Thick-walled according to DIN 1850

When not to use it?

- For applications in wet areas
 - ▶ **iglidur® H, page 325**
- When very high precision is necessary
 - ▶ **iglidur® P, page 185**
- For very smooth shafts
 - ▶ **iglidur® J, page 89**
- When a cost-effective wear resistant bearing is desired
 - ▶ **iglidur® R, page 249**

Graph 01: Permissible pv values for iglidur® M250 with a wall thickness of 1 mm dry running against a steel shaft at +20°C, mounted in a steel housing

iglidur[®] M250 | Technical Data

Mechanical Properties

The recommended maximum surface pressure is a mechanical material parameter. No conclusions regarding the tribological properties can be drawn from this. With increasing temperatures, the compressive strength of iglidur[®] M250 plain bearings decreases.

The Graph 02 shows this inverse relationship. However, at the longterm maximum temperature of +80 °C the permissible surface pressure is almost 10 MPa.

Graph 02: Recommended maximum surface pressure as a function of temperature (20 MPa at +20 °C)

The self lubricating plain bearings made of iglidur[®] M250 are defined by their impact strength, vibration dampening, and wear resistant properties. They excel in applications in which vibration dampening is necessary, for example, in fitness and packaging machines. Since they are additionally able to absorb dirt, they are also suited for agricultural machines and garden appliances.

iglidur[®] M250 bearings can withstand radial loads of a maximum 20 MPa. The material deformation is below 2 % at room temperature. Compared with other iglidur[®] materials iglidur[®] M250 bearings are highly elastic. By this elasticity, they are able to yield very well, but retain their original shape again. A plastic deformation is minimal up to the permissible surface pressure.

► Surface Pressure, [page 43](#)

Graph 03: Deformation under pressure and temperature

Permissible Surface Speeds

As standard, iglidur[®] M250 is manufactured as a thick walled bearing. iglidur[®] M250 is best suited for low to medium surface speeds. The maximum permissible speed for dry running applications is 0.8 m/s (rotating) or 2 m/s (linear). In practice, though, this temperature level is rarely reached, due to varying application conditions.

► Surface Speed, [page 45](#)

m/s	Rotating	Oscillating	Linear
Continuous	0.8	0.6	2.5
Short term	2	1.4	5

Table 02: Maximum running speed

Temperatures

The maximum permissible short term temperature is +170 °C. However iglidur[®] M250 plain bearings may only be exposed to this temperature without any additional load. The long term permissible application temperature is +80 °C. This is also the point of the wear limit, i. e. the temperature over which the wear increases exponentially.

► Application Temperatures, [page 46](#)

iglidur [®] M250	Application temperature
Minimum	-40 °C
Max. long term	+80 °C
Max. short term	+170 °C
Add. securing is required from	+60 °C

Table 03: Temperature limits

Friction and Wear

The coefficient of friction μ of a plain bearing among other things is influenced by the surface speed and the load. If the load stays constant, then the coefficient of friction increases with increasing speed (see Graph 04).

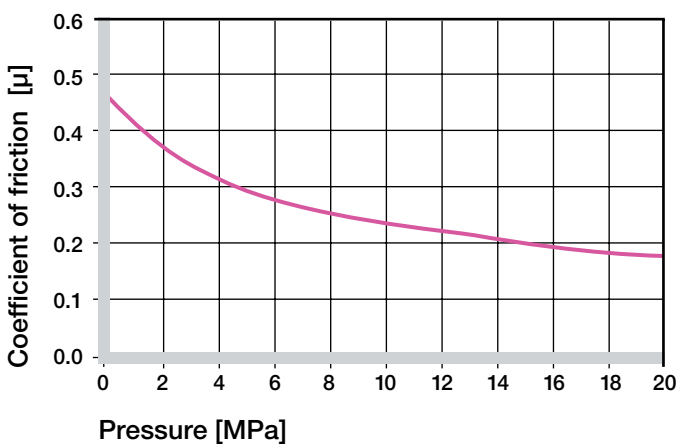

On the other hand, an increase in load at constant speed can result in a reduction in the coefficient of friction (see Graph 05).

► Coefficients of Friction and Surfaces, **page 48**

► Wear Resistance, **page 49**

Graph 04: Coefficient of friction as a function of the running speed, $p = 0.75$ MPa

Graph 05: Coefficient of friction as a function of the pressure, $v = 0.01$ m/s

Shaft Materials

Friction and wear are also greatly dependent on the surface of the shaft. If you observe the coefficient of friction, then the ideal shaft surface finish for iglidur® M250 bearings is $R_a = 0.6$ μm (Graph 06).

Graphs 07 to 09 show results of testing different shaft materials with plain bearings made of iglidur® M250. Up to loads of 2 MPa the shaft material plays a relatively small role for rotational movements. Graph 07 best illustrates which shaft materials are best suited for smaller loads. If the load increases, the wear of a bearing clearly increases. Therefore, a suitable shaft material must be considered for higher loads. These are hardened shafts, such as cold-rolled steel or hard chromed shafts. Graph 09 makes it clear that iglidur® M250 is considerably better for rotational than for oscillating operation. However, it must be mentioned that in oscillating movements, often the vibrations acting on the bearing are especially high. Here, iglidur® M250 can utilise its special dampening properties. In our test, these vibrations are excluded so that the comparison between rotation and oscillating operation is captured first.

Additional Properties

Chemical Resistance

iglidur® M250 plain bearings have a good resistance to chemicals. They are resistant to most lubricants. iglidur® M250 are not affected by most weak organic and inorganic acids.

► Chemical Table, page 974

Medium	Resistance
Alcohol	+ to 0
Hydrocarbons	+
Greases, oils without additives	+
Fuels	+
Diluted acids	0 to –
Strong acids	–
Diluted alkalines	+
Strong alkalines	0

+ resistant 0 conditionally resistant – not resistant

All data given at room temperature [+20 °C]

Table 05: Chemical resistance

Radiation Resistance

Plain bearings made from iglidur® M250 can be used conditionally under radioactive radiation. They are resistant to radiation up to a radiation intensity of $1 \cdot 10^4 \text{ Gy}$.

UV Resistance

iglidur® M250 plain bearings are permanently resistant to UV radiation.

Vacuum

In a vacuum environment, the iglidur® M250 plain bearing releases moisture as vapour. The relatively high moisture absorption of the bearing allows only limited use in the vacuum.

Electrical Properties

iglidur® M250 plain bearings are electrically insulating.

Volume resistance	$> 10^{13} \Omega\text{cm}$
Surface resistance	$> 10^{11} \Omega$

Moisture Absorption

The moisture absorption of iglidur® M250 plain bearings is approximately 1.4 % in standard atmosphere. The saturation limit in water is 7.5 %. This must be taken into account along with other application conditions.

Maximum moisture absorption

At +23 °C/50 % r.h. 1.4 % weight

Max. moisture absorption 7.6 % weight

Table 06: Moisture absorption

Graph 10: Effect of moisture absorption on plain bearings

Installation Tolerances

iglidur® M250 plain bearings require a relatively large amount of clearance for optimal operation. This ensures that the bearing remains reliable during temperature change and water absorption. This clearance, which would not be acceptable for a metallic plain bearing, allows the iglidur® M250 to exhibit its best qualities, such as wear resistance and maintenance free operation. The disadvantages of the clearance are minimised by the vibration dampening properties. The bearings are designed for pressfit into a housing machined to a H7 tolerance. After being assembled into a nominal size housing, the inner diameter adjusts to meet the specified tolerances.
